

# NATIONAL RIVER FLOW ARCHIVE

## WINFAP-FEH DATA FILES VERSION 4.1

### NOTE ON CHANGES FROM V4

**RELEASE DATE: 26 MAY 2016**

---

Version 4.1 of the WINFAP-FEH Data Files is published as an amendment to Version 4. The changes made in this version affect the flow data at stations categorised as 'POT excluded' only. The amendment is important for any single site, enhanced single site or pooling analyses in which these sites may be used.

Stations are categorised as POT excluded where the gauged catchment response does not lend itself to Peaks Over Threshold (POT) analysis. Such catchments are usually, but not exclusively, those dominated by baseflow and are therefore often concentrated on the large chalk aquifers of southern and eastern England.

By definition, POT excluded stations do not present POT data files in the WINFAP-FEH download, but do present AMAX data files. An error in the file export code used for the previous release (Version 4) meant that no AMAX data files were presented in the download at POT excluded stations. This issue has now been corrected and all users should download the Version 4.1 files for use in WINFAP-FEH.

There are no other changes to the data files since Version 4. For the most recent list of major changes (e.g. to flow data and station suitability) users should refer to the release note for Version 4.
